FINANCIAL SERVICES IN ORBIT

## Job Description: Software Developer

*Help Trade in Space to develop our core products—satellite activated Smart Contract Systems to support global payments and transactions*

### The Role

We're looking for a software developer to join our team on a full-time basis. This role will involve supporting the development of technical requirements, and our core product, as well as working with satellite generated data (earth observation / imagery data, and narrow-band telecommunications data) to develop our product.

We're a new company, so you'll also have a big part to play in the development of our technical product roadmap, and in building our team.

### Skills and Experience

Have you ever written smart contract code? Few people have, but you should at least know what one is, and if you have skills in Java, JSON, GO, C, Ruby, Python, Docker or better yet Solidity, GoLang, or any other OOP derived language—you shouldn't find it too difficult. It's likely you'll have a degree in a technical field—but to us skills, experience and a great attitude are the main attributes that you'll possess and we welcome applications from any candidates that may be suitable.

Are you ready to step up and help to make a power house of the new space economy? When you join you'll immediately be a key member of the team, with a need to take responsibility for tasks and drive these towards completion—but be responsive to management instruction and direction.

### Benefits

As well as the opportunity to help build Trade in Space from the start, and :

\*Competitive Salary,

\*Crypto-pension,

\*Flexible working hours

\*30 Days paid holiday per year.

To Apply, Send your CV and a Covering Letter to:
